

FIG. 2

FIG. 3 is a flowchart illustrating a process for generating a package based on a request from a consumer. The process begins with receiving a request from a consumer (206). The request is then used to identify potential providers (302). This step involves a query/response (310) with an Item/Provider Database System (210). The database system contains two databases: Items and Agreements. The identified potential providers are then used to generate a package (304). The generated package is submitted to a compensation processor (306). Finally, the package information is returned to the consumer (308).
